

# The LKS-UK window intercom makes window communications go smoothly.

## Clear speech from both sides of a security screen.

Security screens are points of sale and information exchange where business takes place quickly and efficiently. Good communication between the service provider and the customer is essential whilst ensuring staff safety is not compromised. Clear speech paths must be available for both and it is in this environment where HAGO systems provide various solutions.

## Which is the best type of system for you?

Each workplace imposes different demands on the system. Where will the system be installed, indoors or outdoors? Will the system be installed in a noisy station hall or precisely in a narrow passage? How many people will make use of it? Sometimes aesthetic appearance or privacy also plays a part. HAGO systems offer a number of possibilities. Simple and robust standard models, but also very sophisticated models; for special applications, such as a rod microphone in combination with, for example, a ceiling-mounted loudspeaker, electret microphones with a section no larger than 4 mm which can be built in, etc.

## The LKS-UK window intercom.

The standard LSK-UK system consists of an operating position with window loudspeaker

(diameter 10 cm) and an electret microphone. As soon as there is a customer at the window, the window operator activates the system, pressing the TALK key allowing the user to speak with an LED indicating direction of speech.

The volume on both sides can be controlled by simple foil button operation, no potentiometer involved. The system switches itself off after a pre-set time when this is activated on the TIMER, which also applies to the time in/out setting. A handy feature allows the user to return to the default setting of the LKS-UK at any time by means of one simple action.

The UNLOCK key allows the user to unlock a door or access. With the OPEN key an access or door can be opened by remote control. The system is easy to install by following the clear instructions which come with the system. A connecting cable with a length of 1.5 metres is part of the standard delivery.

The LKS-UK/D offers more hands-free functions. The

LKS-UK/D allows you to opt for either simplex or

duplex. Sometimes, depending on the situation, an "open" duplex system is required.

By simply pressing the ON/OFF key, both the customer and the window operator can speak without further actions (hands-free). The volume can be further increased *towards the outside* by keeping the SPEAK/LISTEN key depressed during the conversation.

## Headset.

An optional headset is available which provides mobility for staff and allows them to operate, for example, a PC during the conversation. The headset has a choice of wired or wireless models. When a headset is connected, both the loudspeaker and the microphone are switched off automatically from the operating table.

The headset makes the LKS-UK a very professional and efficient unit intercom system.

This version is also in simplex mode available.

# LKS-UK

## Features

- simplex or duplex conversation timer
- unlock door/access
- LED signalling
- software volume controlled
- window loudspeaker with electret-microphone
- also seperated microphone possible
- size: L x W x H  
180 x 110 x 45/65mm
- duplex intercom

## Options

- headset connection
- wired or wireless headset
- headset is open duplex also with simplex version
- microphone in combination with for example a ceiling mounted loudspeaker
- customised configuration is possible
